

ABSTRACT OF THE DISCLOSURE

A signal processing unit 50 in a wireless base station forms an omnidirectional pattern to intermittently transmit a control signal, forms an antenna array pattern to receive a control signal from a mobile station, and further transmits a link channel allocation using either an omnidirectional pattern or an antenna array pattern.

1. A signal processing unit in a wireless base station forms an omnidirectional pattern to intermittently transmit a control signal, forms an antenna array pattern to receive a control signal from a mobile station, and further transmits a link channel allocation using either an omnidirectional pattern or an antenna array pattern.
